Overview
The AHIMA Leadership Models for e-HIM® aim to develop a comprehensive framework and suite of tools that both educate and guide HIM professionals to visualize, initiate and lead specific HIM domain initiatives at institutional, regional, and national levels.

There are multiple levels of leadership created by organizational reporting structures and job positions causing the terms leader and manager to be used interchangeably. Although they overlap, the two terms are technically different. Managers are responsible for ensuring current operations run smoothly whereas leaders strive to help organizations adapt to changing conditions.¹

AHIMA’s leadership models focus on an action-centered model of leadership aimed at providing guidance to HIM professionals to advance technical HIM concepts and precepts, regardless of the individual’s current role within an organization. These tools and techniques aspire to help HIM professionals apply theory and technical knowledge using leadership techniques to drive institutions and the healthcare industry toward achieving the vision of e-HIM®.

AHIMA’s leadership model concepts were adapted from Dr. Vinay Dabholkar’s “3 I’s of Technical Leadership”². According to Dabholkar, technical leaders should exhibit characteristics and behaviors of initiative, influence and independence.

Independence requires individuals to make and communicate sound decisions and take responsibility for the decisions that are made. Initiative requires individuals to assess situations, propose solutions, obtain sponsorship, and negotiate and execute decisions. Influence affects the decision made by others and impacts the creation and delivery of solutions.

AHIMA’s Leadership Models for e-HIM® are intended to guide HIM professionals through the technical aspects of an HIM domain topic that require effective leadership. Although the models contain specific technical leadership goals and sample management activities, users of the models must take it upon themselves to assess their own leadership skills and identify personal opportunities for growth and advancement as an effective leader. There is a wealth of information available on leadership. A condensed list of leadership resources is provided to get you started.

How to Use Leadership Models for e-HIM®
AHIMA’s Leadership Models for e-HIM® are designed in a matrix format containing four types of information. Leadership goals provide a description of planned or intended outcomes associated with effective leadership in the e-HIM® domain. Leadership characteristics/behaviors describe key leadership “soft skills” required to effectively achieve the leadership goals. Each model contains a variety of sample management activities that may support individuals and organizations in successfully achieving the defined leadership goals. In addition, the matrix provides a list of tools and resources that support the leadership goals, behaviors and sample activities detailed in the model.

**Table: Leadership Characteristics and Behaviors**

<table>
<thead>
<tr>

**Data Content Standards**

Quality information is essential to all aspects of today’s healthcare system. Many healthcare errors and adverse events occur as a result of poor data and information. In addition to threatening patient safety, poor data quality increases healthcare costs and inhibits health information exchange, research, and performance measurement initiatives. Improving the quality of data, information, and knowledge is paramount as healthcare organization transition from paper to electronic health records.

The challenges associated with maintaining high quality data in electronic information environments require a clear understanding of data content standards and effective coordination and management of the organization’s data requirements. As experts in the management and use of health records and secondary data, HIM professionals should serve as the leaders in health care organizations and in their professional community for ensuring that data content standards are identified, understood, implemented and managed.

**Legal Electronic Health Record**

An individual’s health record is considered to be a legal business record for the healthcare organization that creates and maintains it. As such, it must be maintained in a manner that complies with applicable regulations, accreditation standards, professional practice...
standards, and legal standards. However, as is the case with much information today, health records are increasingly created and reside in several different formats and information systems with varying business rules and operational requirements. HIM professionals are charged with ensuring that information management standards are developed and consistently applied across these various systems in order to maintain the level of integrity necessary for health records to meet the healthcare organization’s business and legal needs.

The challenges associated with maintaining legally sound health records in the hybrid and electronic information environments require clear identification of the issues, re-thinking of traditional record and information management practices and development and application of new strategies for managing health information. As experts in the requirements for health records, HIM professionals serve as the leaders in health care organizations and in their professional community for ensuring that such requirements are identified and met.
